Event Management System

What I supposed to do is,

Build a personal event management system that will help track family's and friends' birthdays, anniversaries, etc.
The following features are required at a minimum:

* the ability to enter a new event
* the ability to edit an event
* the ability to delete an event
* the ability to search for events by a person's name
* the ability to search for events by event type
* show upcoming events - e.g., events in the next 7 days

I have done some of the requirements above by using python.
For User interface I used python module called tkinter.
Installed xampp for creating local server(mysql server).
I have created database on xampp.
Inserted values using python code in mysql server which is in xampp.
